Processor Documentation

Ruben Saunders

August 2024

1 Principals

- This processor will operate a RISC instruction set.
- This processor has a word size of 64 bits, and supports both floats (4 bytes) and doubles (8 bytes).
- The instruction set will provide methods to load values into and out of registers. Then, most operations will be on registers.
- Load/store instructions operate on 32-bit immediates.
- Arithmetic and logic instructions operate on full registers, so 64-bit.

2 Registers

See below for a list of registers. All registers are 64-bit. Register names are preceded by a dollar '\$' sign.

Symbol	Name	Bit	Description			
Special Registers						
\$ip	Instruction Pointer		Point to next address to execute as an instruction.			
\$sp	Stack Pointer		Top address of the stack.			
\$fp	Frame Pointer		Point to the next byte beyond the last stack frame.			
\$flag	Flag Register	6-64				
		5	Error status: 1=error, 0=ok.			
		9	Indicates if exited gracefully.			
		4	Execution status: 1=executing, 0=halted.			
			Zero flag.			
		3	Indicates if register is zero.			
			Updated on most instructions' dest register.			
			Comparison bits.			
			• 000: not equal.			
			• 001: equal.			
		0-2	• 010: less than.			
			• 011: less than or equal to.			
			• 110: greater than.			
			• 111: greater than or equal to.			
\$ret	Return Value Register		Contains value returned from function, syscall, etc.			
φiet	Return value Register		Contains process exit code on halt.			
\$zero	Zero		Hardwired to zero.			
	General Purpose Registers					
r1 - r16	GPRs		Register for general use.			
Фа 1 Фа	Preserved GPRs		Register for general use.			
s1 - s8	rreserved GPRS		Values are preserved in stack frame.			

3 Addressing Modes

An argument can have the following type.

Indicator	Name	Syntax	Operation	Size
00	Immediate	imm	imm	32
01	Memory	(mem)	Mem[mem]	32
10	Register	\$reg	Reg[\$reg]	8
11	Register Indirect	n(\$reg)	Mem[Reg[\$reg] + n]	\$reg=8, \$n=24

The following values are used on the ISA specification:

Argument	Size	Comment	
<reg></reg>	8	Register offset.	
<value></value>	2 + 32	Any listed addressing mode.	
\value/		2 indicator bits, 32 for data.	
<addr></addr>	r> 2 + 32	Any listed addressing mode except immediate.	
\audr>		2 indicator bits, 32 for data.	

4 Instruction Set

Load Upper Load veg	Instruction	Syntax	Operation/Comments			
Load Upper loadu <reg> <value> Reg[\$reg] = \$value Load a half-word (32-bit) into the upper half of a register. Reg [\$reg] [32:] = \$value Pseudo-instruction. Loads a word (64-bit) into a register. load \$reg \$value :32] loadu \$reg \$value :32] loadu \$reg \$value :32:] Zero</value></reg>	Data Transfer					
Load Upper Loadu < reg> < value> Load a half-word (32-bit) into the upper half of a register. Reg[\$reg] [32:] = \$value Pseudo-instruction. Loads a word (64-bit) into a register. Loads \$reg \$value[32:] Pseudo-instruction. Zeroe zero < reg> Zeroe Zeroe Zeroes/clears a register. Zeroes/clears a register. Zeroes/clears a register. Zeroes/clears a register to memory. Mem[\$addr] = Reg[\$reg]	Load	load (ros) (value)	Load a half-word (32-bit) into a register.			
Load Upper loadu <pre> loadu <pre> Reg[\$reg] [32:] = \$value Pseudo-instruction. Load word Loadw Loadw Loadw Reg Svalue Svalue</pre></pre>	Load	load (leg) (value)	Reg[\$reg] = \$value			
Load Word loadw <reg> <value> </value></reg>	Load Happer	loady (rog) (value)	Load a half-word (32-bit) into the upper half of a register.			
Load Word loadw <reg> <value> Loads a word (64-bit) into a register. load \$reg \$value[:32] loadu \$reg \$value[:32:] Pseudo-instruction. Zeroe / Zeroe Store Store Store < reg> <addr></addr></value></reg>	Load Opper	Toadu (Teg) (Value)				
Load Word Loadw (reg) (value) Loadu \$reg \$value[:32] Loadu \$reg \$value[32:] Pseudo-instruction. Zero						
Compare Comp	Load Word	loadu (reg) (value)	, ,			
Pseudo-instruction. Zeroes/clears a register. xor \$reg, \$reg	Lond Word	Todaw (Tog) (Value)				
Zeroe Zeroes Ze						
Store store <reg> <addr> Store Subtract Subtract</addr></reg>						
Store store <reg> <addr> Copy from register to memory. Mem[\$addr] = Reg[\$reg] </addr></reg>	Zero	zero <reg></reg>	Zeroes/clears a register.			
Arithmetic Add add <reg> <reg> <value> Arithmetic Add value to a register. Reg[\$reg1] = Reg[\$reg2] + \$value Subtract sub <reg> <reg> <value> Subtract value from a register. Reg[\$reg1] = Reg[\$reg2] - \$value Multiply mul <reg> <reg> <value> Multiply register by a value. Reg[\$reg1] = Reg[\$reg2] × \$value Multiply register by a value. Reg[\$reg1] = Reg[\$reg2] × \$value Division div <reg> <reg> <value> Divide a register by a value. Reg[\$reg1] = Reg[\$reg2] ÷ \$value Divide a register by a value. Reg[\$reg1] = Reg[\$reg2] ÷ \$value Divide a register by a value, cast result to integer. Reg[\$reg1] = [Reg[\$reg2] ÷ \$value Divide a register by a value, cast result to integer. Reg[\$reg1] = [Reg[\$reg2] ÷ \$value Compare \$1 with \$2, setting comparison bits in flag register. E.g., set 1t iff \$1 < \$2. Note Z flag is set depending on value, not register. Pseudo-instruction. load ip \$addr Branch to the given address if comparison matches conditional.</value></reg></reg></value></reg></reg></value></reg></reg></value></reg></reg>						
Arithmetic Add add <reg> <reg> <value> Reg[\$reg1] = Reg[\$reg2] + \$value Subtract sub <reg> <reg> <value> Reg[\$reg1] = Reg[\$reg2] + \$value Multiply mul <reg> <reg> <value> Multiply register by a value. Reg[\$reg1] = Reg[\$reg2] - \$value Multiply register by a value. Reg[\$reg1] = Reg[\$reg2] × \$value Division div <reg> <reg> <value> Divide a register by a value. Reg[\$reg1] = Reg[\$reg2] ÷ \$value Divide a register by a value. Reg[\$reg1] = Reg[\$reg2] ÷ \$value Divide a register by a value, cast result to integer. Reg[\$reg1] = [Reg[\$reg2] ÷ \$value Divide a register by a value, cast result to integer. Reg[\$reg1] = [Reg[\$reg2] ÷ \$value Divide a register by a value, cast result to integer. Reg[\$reg1] = [Reg[\$reg2] ÷ \$value Branching Compare \$1 with \$2, setting comparison bits in flag register. E.g., set 1t iff \$1 < \$2. Note Z flag is set depending on value, not register. Pseudo-instruction. load ip \$addr Branch to the given address if comparison matches conditional.</value></reg></reg></value></reg></reg></value></reg></reg></value></reg></reg>	Store	store (res) (addr)	Copy from register to memory.			
Add value to a register. Reg[\$reg1] = Reg[\$reg2] + \$value Subtract Sub {reg} {reg} {value} Subtract value from a register. Reg[\$reg1] = Reg[\$reg2] - \$value Multiply mul {reg} {reg} {value} Multiply register by a value. Reg[\$reg1] = Reg[\$reg2] \times \$value Reg[\$reg1] = Reg[\$reg2] \times \$value Bivision div {reg} {reg} {value} Divide a register by a value. Reg[\$reg1] = Reg[\$reg2] \times \$value Bivide a register by a value. Reg[\$reg1] = Reg[\$reg2] \times \$value Divide a register by a value, cast result to integer. Reg[\$reg1] = [Reg[\$reg2] \times \$value Divide a register by a value, cast result to integer. Reg[\$reg1] = [Reg[\$reg2] \times \$value\$ Branching Compare \$1 with \$2, setting comparison bits in flag register. E.g., set 1t iff \$1 < \$2. Note Z flag is set depending on value, not register. Pseudo-instruction. load ip \$addr Branch to the given address if comparison matches conditional.	Dioic	Store (reg) (addr)	Mem[\$addr] = Reg[\$reg]

		Logical		
Bitwise NOT a register				
Not	not <reg> <reg></reg></reg>	$Reg[\$reg1] = \sim Reg[\$reg2]$		
A m d		Bitwise AND between register and value.		
And	and <reg> <reg> <value></value></reg></reg>	Reg[\$reg1] = Reg[\$reg2] & \$value		
0	(Bitwise OR between register and value.		
Or	or <reg> <reg> <value></value></reg></reg>	Reg[\$reg1] = Reg[\$reg2] \$value		
Exclusive Or	wan (mam) (mam) (walus)	Bitwise exclusive-OR between register and value.		
Exclusive Of	xor <reg> <reg> <value></value></reg></reg>	Reg[\$reg1] = Reg[\$reg2] \oplus \$value		
Logical Right Shift	shr <reg> <reg> <value></value></reg></reg>	Logically shift the register right an amount.		
Logical Hight Shift	Siii (leg/ (leg/ (Value/	$Reg[$reg1] = Reg[$reg2] \gg $value$		
Logical Left Shift	shl <reg> <reg> <value></value></reg></reg>	Logically shift the register left an amount.		
Logical Left billit	Shi (leg) (leg) (value)	$Reg[$reg1] = Reg[$reg2] \ll $value$		
		Stack		
		Push a value onto the stack.		
Push	push <value></value>	Mem[Reg[sp]] = \$value		
		Reg[sp] += 4		
		Pseudo-instruction		
Push Long	pushl <value></value>	Push a 64-bit value onto the stack.		
1 usii Long	pushi \vaiue>	<pre>push \$value[:32]</pre>		
		<pre>push \$value[32:]</pre>		
		Pseudo-instruction		
Don	non [mom]	Pop value from the stack, load into register if provided.		
Pop	pop [reg]	sub sp, 4		
		If register: load \$reg, (sp)		
	popl [reg]	Pseudo-instruction		
D I		Pop a 64-bit value from the stack, load into register if provided.		
Pop Long		sub sp, 8		
		If register: loadl \$reg, (sp)		
	1	Functions		
D	11 (1-1)	Call procedure at location value.		
Function Call	call <value></value>	More complex than load ip, \$value as pushes stack frame.		
		Pseudo-instruction		
		Push all argument values onto the stack.		
		Useful shorthand for function call.		
Q. A.		push \$value1		
Store Arguments	stargs <value> <value></value></value>	-		
		push \$valuen		
		push n		
		Note assembler caches this n .		
		Pseudo-instruction		
DT A		Tells assembler that the next function call expects no arguments.		
No Arguments	noargs	push 0		
		Note caches $n = 0$.		
		Pseudo-instruction		
		Load the <i>i</i> th argument (assuming all 32-bit) into the register.		
Load Argument	\mid ldarg <reg> i</reg>	load \$reg, $off(fp)$		
		Note see "retrieving arguments" for off calculation.		
		Note number of arguments, n , is cached by the assembler.		
Return	ret	Return from function call.		
C C 11		Invoke the system call mapped to the given value.		
System Call	syscall <value></value>	See the respective section for mappings.		
	Τ.	/ Iiscellaneous		
112100014UIOUUD				

		Useless operation; do nothing.
No-Operation \square	nop	Equivalent to or r1, 0.
		Implemented as actual operation for efficiency.
		Pseudo-instruction
Exit	exit	Exit/halt the program.
		syscall <opcode: exit=""></opcode:>

4.1 Pseudo-Instructions

These are instructions which are not necessary for full functionality, but are provided for usefulness. They may be implemented using other instructions. It is up to the implementer whether to implement these as actual instructions or expand them to their equivalent form.

4.2 Instruction Layout

All instructions are encoded in a single 64-bit word. The layouts of various types is listed below. The size field stated the size in bits of this field. From top-to-bottom, the table starts at the least-significant bit.

Note, the opcode of each instruction is not decided upon; it may be any value as long as the instruction set is implemented. The only exception is nop, which maps to a fully-zeroed word.

Generic Layout A generic instruction layout, including the optional conditional testing. Most instructions take this format.

Bit	Purpose	Comments
0-5	Opcode	
6-9	Conditional test	These bits are tested against \$flag to determine if instruction is executed or skipped. • 1111: skip test. • 1001: test if zero flag is set. • 1000: test if zero flag is unset. Otherwise, match lower 3 bits to \$flag.
10-64	Instruction depen	dant.

Data-Type Inidicator Some instructions have a field to specify the data-type of the data being operated on. These bits are after the ordinary header, and are as follows:

Bit 0 Decimal?	Bit 1 Signed?	Bit 0 Full or half word?	Suffix	Comments
0	0	0	hu	32-bit unsigned integer.
0	0	1	[u]	64-bit unsigned integer.
0	1	0	hs	32-bit signed integer.
0	1	1	s	64-bit signed integer.
1	0	0	f	32-bit float.
1	0	1	d	64-bit double.

5 Calling Convention

Despite being a RISC processor, this processor will support explicit call and ret functions which will aid in pushing and popping a stack frame. For ease of programming, multiple actions are taken in each to maintain structure, so they are not pseudo-instructions.

5.1 Function Invocation

To call a function [at] func with n arguments:

push <arg1>

. . .

push <argn>
push n
call <func>

Note when zero arguments are needed, still push 0 to indicate this.

Stack					
Before	After				
	preserved GP registers	← \$sp			
	old ip				
	old fp	$\leftarrow \$ \mathrm{fp}$			
	n				
	args				
$xxx \leftarrow \$sp$	XXX				

5.2 Function Returning

To return from the function invoked in the previous sub-section, we need only a call to ret. This will restore and pop the stack frame, as well as handle any arguments the user pushed. The following operations take place:

Reg[\$ip] = old ip
Reg[\$fp] = old fp
Reg[\$sp] = loc(xxx)

5.3 Argument Retrieval

The frame pointer points to the top of the previous frame. Using the diagram above, it is possible to retrieve an argument from the stack. It is important to note that the size of the additional information pushed via the processor may theoretically vary, and so referencing and relying on knowledge of this size is unadvised.

i: argument index, 0-indexed; n: number of arguments. Arg i = Reg[\$fp] - 4 * (1 + n - i)

6 System Call

System calls are core functionality abstracted inside the processor. Actions are assigned operation codes and invoked via syscall <opcode>. Optionally, each read arguments from general-purpose registers r1 onward.

Service	1 0		Result			
	Output					
$\operatorname{print_int}$	1	r1 = integer	Print 64-bit integer.	None		
print_float	2	r1 = float	Print 32-bit float.	None		
print_double	3	r1 = double	Print 64-bit double.	None		
print_char	4	r1 = byte	Print byte as ASCII character.	None		
print_string	5	r1 = string address	Print null-terminated string at the address.	None		
	Input					
read_int	6	None	Read a signed 64-bit integer.	\$ret = integer		
read_float	7	None	Read a 32-bit float.			
read_double	8	None	Read a 64-bit double.			
read_char	9	None	Read an ASCII character.	$\mathtt{$ret} = \mathrm{character}$		
nood atning	10	r1 = string address	Read a null-terminated string into given address.	None		
read_string	10	$r2 = \max length$	String is truncated to maximum length.	None		
Program Flow						
exit	11	None	Exit program.	None		
exit2	12	r1 = exit code	Exit program with the given code.	None
