Processor Documentation

Ruben Saunders

August 2024

Principals 1

- This processor will operate a RISC instruction set.
- This processor has a word size of 64 bits, and supports both floats (4 bytes) and doubles (8 bytes).
- The instruction set will provide methods to load values into and out of registers. Then, most operations will be on registers.
- Load/store instructions operate on 32-bit immediates.
- Arithmetic and logic instructions operate on full registers, so 64-bit.

$\mathbf{2}$ Registers

See below for a list of registers. All registers are 64-bit. Register names are preceded by a dollar '\$' sign.

Symbol	Name	Bit	Description			
Special Registers						
\$ip	Instruction Pointer		Point to next address to execute as an instruction.			
\$sp	Stack Pointer		Top address of the stack.			
\$fp	Frame Pointer		Point to the next byte beyond the last stack frame.			
\$flag	Flag Register	6-64				
		5	Error status: 1=error, 0=ok.			
			Indicates if exited gracefully.			
		4	Execution status: 1=executing, 0=halted.			
			Zero flag.			
		3	Indicates if register is zero.			
			Updated on most instructions' dest register.			
			Comparison bits.			
			• 000: not equal.			
			• 001: equal.			
		0-2	• 010: less than.			
			• 011: less than or equal to.			
			• 110: greater than.			
			• 111: greater than or equal to.			
\$ret	Return Value Register		Contains value returned from function, syscall, etc.			
\$zero	Zero		Hardwired to zero.			
	General Purpose Registers					
r1 - r16	GPRs		Register for general use.			
\$s1 - \$s8	Preserved GPRs		Register for general use.			
φ81 – φ8δ	1 reserved Gras		Values are preserved in stack frame.			

General Purpose Registers						
r1 - r16	\$r1 - \$r16 GPRs Register for general use.					
\$s1 - \$s8	Preserved GPRs	Register for general use.				
	Treserved Gras	Values are preserved in stack frame.				

Addressing Modes 3

An generic value has the following format.

Indicator	Name	Syntax	Operation	Size
00	Immediate	imm	imm	
01	Memory	(mem)	Mem[mem]	
10	Register	\$reg	Reg[\$reg]	8
11	Register Offset	n(\$reg)	Reg[\$reg] + n	<pre>\$reg=8, n (signed)</pre>

Note: immediates and memory addresses are 32-bit, registers are 8-bit.

4 Instruction Set

Notes

• All instructions, unless indicated otherwise by a square \square , contain three bits which exceed the opcode: a test bit to indicate if a conditional check is considered, followed by two bits equivalent to the first two bits in the flag register for comparison. If the test bit is 0, the check is skipped. This is indicated in the mnemonic by appending the mnemonic with a comparison code. This is indicated using a comparison postfix after a question mark: z, nz, eq, ne, lt, le, gt, ge. E.g., add?eq.

	Jump ⊔	Jmp <addr></addr>	load ip <addr></addr>			

	I	Branch to the given address if comparison matches conditional.			
Branch \square	b <cnd> <addr></addr></cnd>	See \$flag register.			
	T	Logical Bitwise NOT a register.			
Not	not <reg> <reg></reg></reg>				
		Reg[\$reg1] = ~ Reg[\$reg2]			
And	and <reg> <reg> <value></value></reg></reg>	Bitwise AND between register and value.			
		Reg[\$reg1] = Reg[\$reg2] & \$value			
Or	or <reg> <reg> <value></value></reg></reg>	Bitwise OR between register and value.			
		Reg[\$reg1] = Reg[\$reg2] \$value			
Exclusive Or	xor <reg> <reg> <value></value></reg></reg>	Bitwise exclusive-OR between register and value.			
		Reg[\$reg1] = Reg[\$reg2] ⊕ \$value Logically shift the register right an amount.			
Logical Right Shift	shr <reg> <reg> <value></value></reg></reg>	Reg[\$reg1] = Reg[\$reg2] \gg \$value			
		Logically shift the register left an amount.			
Logical Left Shift	shl <reg> <reg> <value></value></reg></reg>				
		Reg[\$reg1] = Reg[\$reg2] « \$value			
	I	Stack			
D 1		Push a value onto the stack.			
Push	push <value></value>	Mem[Reg[sp]] = \$value			
		Reg[sp] += 4			
		Pseudo-instruction			
Push Long	pushl <value></value>	Push a 64-bit value onto the stack.			
		push \$value[:32]			
		push \$value[32:]			
	pop [reg]	Pseudo-instruction			
Pop		Pop value from the stack, load into register if provided.			
1		sub sp, 4			
		If register: load \$reg, (sp)			
		Pseudo-instruction			
Pop Long	popl [reg]	Pop a 64-bit value from the stack, load into register if provided.			
		sub sp, 8			
		If register: loadl \$reg, (sp)			
		Functions			
Function Call	call <value></value>	Call procedure at location value.			
		More complex than load ip, \$value as pushes stack frame.			
		Pseudo-instruction			
		Push all argument values onto the stack.			
		Useful shorthand for function call.			
Store Arguments	stargs <value> <value></value></value>	push \$value1			
		push \$valuen			
		push n			
		Note assembler caches this n . Pseudo-instruction			
		Tells assembler that the next function call expects no arguments.			
No Arguments	noargs	_ ~			
~		push 0 Note caches $n = 0$.			
		Note caches $n = 0$. Pseudo-instruction			
Load Argument		Load the <i>i</i> th argument (assuming all 32-bit) into the register.			
	ldama (man) i	Load the till argument (assuming an 32-bit) into the register. load \$reg, $off(fp)$			
	\mid ldarg <reg> i</reg>	Note see "retrieving arguments" for off calculation.			
		Note number of arguments, n , is cached by the assembler.			
Return	ret	Return from function call.			
	100	Invoke the system call mapped to the given value.			
System Call	syscall <value></value>	See the respective section for mappings.			
		see the respective accuron for mappings.			

Miscellaneous				
Useless operation; do nothing.				
No-Operation \square	nop	Equivalent to or r1, 0.		
		Implemented as actual operation for efficiency.		
		Pseudo-instruction		
Exit	exit	Exit/halt the program.		
		syscall <opcode: exit=""></opcode:>		

4.1 Pseudo-Instructions

These are instructions which are not necessary for full functionality, but are provided for usefulness. They may be implemented using other instructions. It is up to the implementer whether to implement these as actual instructions or expand them to their equivalent form.

4.2 Instruction Layout

All instructions are encoded in a single 64-bit word. The layouts of various types is listed below. The size field stated the size in bits of this field. From top-to-bottom, the table starts at the least-significant bit.

Note, the opcode of each instruction is not decided upon; it may be any value as long as the instruction set is implemented. The only exception is nop, which maps to a fully-zeroed word.

Argument Size The "addressing mode" section covers argument formatting, while here clarifies the size in bits of each argument type.

Argument	Size	Comment
<reg> 8</reg>		Register offset.
<value></value>	2 + 32	Any listed addressing mode.
\vaiue>		2 indicator bits, 32 for data.
<addr></addr>	2 + 32	Any listed addressing mode except immediate.
\audi/	2 + 32	2 indicator bits, 30 for data.

Generic Layout A generic instruction layout, including the optional conditional testing. Most instructions take this format.

Bit	Purpose	Comments	
0-5	Opcode		
6	Conditional test	If test=1: The next three bits are compared to respective bits in \$flag. The instruction is only executed if they match. Otherwise, the test is skipped.	
7-9	Test bits Same as bits 0-2 in \$flag.		
10-64	Instruction dependant.		

Data-Type Inidicator Some instructions have a field to specify the data-type of the data being operated on. These bits are after the ordinary header, and are as follows:

Bit 0	Bit 1	Bit 0	Suffix	Comments	
Decimal?	Signed?	Full or half word?	Sumx	Comments	
0	0	0	hu	32-bit unsigned integer.	
0	0	1	[u]	64-bit unsigned integer.	
0	1	0	hs	32-bit signed integer.	
0	1	1	s	64-bit signed integer.	
1	0	0	f	32-bit float.	
1	0	1	d	64-bit double.	

5 Calling Convention

Despite being a RISC processor, this processor will support explicit call and ret functions which will aid in pushing and popping a stack frame. For ease of programming, multiple actions are taken in each to maintain structure, so they are not pseudo-instructions.

5.1 Function Invocation

To call a function [at] func with n arguments:

```
push <arg1>
...
push <argn>
push n
call <func>
```

Note when zero arguments are needed, still push 0 to indicate this.

	Stack					
Before	After					
	preserved GP registers	$\leftarrow \$sp$				
	old ip					
	old fp	$\leftarrow \$ \mathrm{fp}$				
	n					
args						
$xxx \leftarrow \$\mathrm{sp}$	XXX					

5.2 Function Returning

To return from the function invoked in the previous sub-section, we need only a call to ret. This will restore and pop the stack frame, as well as handle any arguments the user pushed. The following operations take place:

```
Reg[$ip] = old ip
Reg[$fp] = old fp
Reg[$sp] = loc(xxx)
```

5.3 Argument Retrieval

The frame pointer points to the top of the previous frame. Using the diagram above, it is possible to retrieve an argument from the stack. It is important to note that the size of the additional information pushed via the processor may theoretically vary, and so referencing and relying on knowledge of this size is unadvised.

```
i: argument index, 0-indexed; n: number of arguments.

Arg i = \text{Reg}[\$fp] - 4 * (1 + n - i)
```

6 System Call

System calls are core functionality abstracted inside the processor. Actions are assigned operation codes and invoked via syscall <opcode>. Optionally, each read arguments from general-purpose registers r1 onward.

Service	Opcode	Arguments	Operation	Result		
	Output					
print_int	1	r1 = integer	Print 64-bit integer.	None		
print_float	2	r1 = float	Print 32-bit float.	None		
print_double	3	r1 = double	Print 64-bit double.	None		
print_char	4	r1 = byte	Print byte as ASCII character.	None		
print_string	5	r1 = string address	Print null-terminated string at the address.	None		
			Input			
read_int	6	None	Read a signed 64-bit integer.	$\mathtt{$ret} = integer$		
read_float	7	None	Read a 32-bit float.	$\mathtt{$ret} = \mathtt{float}$		
read_double	8	None	Read a 64-bit double.	$\mathtt{$ret} = double$		
read_char	9	None	Read an ASCII character.	$\mathtt{$ret} = \mathrm{character}$		
read_string	10	r1 = string address	Read a null-terminated string into given address.	None		
read_string	10	$r2 = \max length$	String is truncated to maximum length.	TVOILE		
Program Flow						
exit	11	None	Exit program.	None		
exit2	12	r1 = exit code	Exit program with the given code.	None
